

Seifert – Van Kampen Theorem, Applications

Yahya Tamur

February 25, 2022

Knots

- ▶ A knot is a subset of \mathbb{R}^3 homeomorphic to \mathbb{S}^1 (or more generally, any subset of a topological space homeomorphic to \mathbb{S}^n).

- ▶ A knot K is equivalent to K' if (K, \mathbb{R}^3) is homeomorphic to (K', \mathbb{R}^3)

In other words, there's a homeomorphism

$$h : \mathbb{R}^3 \rightarrow \mathbb{R}^3 \text{ so that } h(K) = K'$$

Then,

$$h|_{\mathbb{R}^3 - K} : \mathbb{R}^3 - K \rightarrow \mathbb{R}^3 - K'$$

is also a homeomorphism,

- ▶ ... and its induced homeomorphism from the fundamental groups

$$\pi_1(\mathbb{R}^3 - K) \rightarrow \pi_1(\mathbb{R}^3 - K')$$

is an isomorphism, so those groups are isomorphic.

- ▶ The group $\pi_1(\mathbb{R}^3 - K)$ is also called the fundamental group of a knot.
- ▶ The main argument we'll be making is, if the fundamental groups of two knots aren't isomorphic, then the knots aren't equivalent.
- ▶ Seifert – Van Kampen's Theorem helps determine the fundamental group of $A \cup B$ given the fundamental groups of A , B , and $A \cap B$.
- ▶ In this presentation, we'll be looking at the statement and proof of this theorem, and applying it to find the fundamental groups of a few knots.

Seifert – Van Kampen Theorem

- ▶ Let X be a path-connected topological space, x_0 be any point in X . Let $\{U_\lambda\}_{\lambda \in \Lambda}$ be an open cover of X so that each U_λ contains x_0 and the intersection of any two elements in the cover is also in the cover.
- ▶ *here, $\{U_\lambda\}_{\lambda \in \Lambda}$ could be $\{A, B, A \cap B\}^*$
- ▶ Let ψ_λ be the homomorphism induced by the inclusion map $U_\lambda \rightarrow X$.
- ▶ For $U_\lambda \subseteq U_\mu$, let $\phi_{\lambda\mu}$ be the homomorphism induced by the inclusion map $U_\lambda \rightarrow U_\mu$. Clearly, the following commutes:
- ▶ Let H be any group and $\{p_\lambda\}_{\lambda \in \Lambda}$ be any family of homomorphisms so the following commutes:

$$\begin{array}{ccc} \pi_1(U_\lambda) & \xrightarrow{\phi_{\lambda\mu}} & \pi_1(U_\mu) \\ & \searrow \psi_\lambda & \downarrow \psi_\mu \\ & & \pi_1(X) \end{array}$$

- ▶ Then, there's a unique σ so that the following commutes:

$$\begin{array}{ccc} \pi_1(U_\lambda) & \xrightarrow{\psi_\lambda} & \pi_1(X) \\ & \searrow p_\lambda & \downarrow \sigma \\ & & H \end{array}$$

From this definition, we can tell:

- ▶ If $\alpha \in \pi_1(U_\lambda)$, $\sigma(\psi_\lambda(\alpha)) = p_\lambda(\alpha)$
 - ▶ If $\alpha \in \pi_1(U_\lambda)$, $\beta \in \pi_1(U_\mu)$,
- $$\sigma(\psi_\lambda(\alpha)\psi_\mu(\beta)) = \sigma(\psi_\lambda(\alpha))\sigma(\psi_\mu(\beta)) = p_\lambda(\alpha)p_\mu(\beta)$$
- ▶ For $\{\alpha_i\}_{i=1}^n$ so that $\alpha_i \in U_{\lambda_i}$,
- $$\sigma(\psi_{\lambda_1}(\alpha_1)\psi_{\lambda_2}(\alpha_2)\dots\psi_{\lambda_n}(\alpha_n)) = p_{\lambda_1}(\alpha_1)p_{\lambda_2}(\alpha_2)\dots p_{\lambda_n}(\alpha_n)$$
- ▶ We need to prove that σ is well defined. In other words, if
- $$\psi_{\lambda_1}(\alpha_1)\psi_{\lambda_2}(\alpha_2)\dots\psi_{\lambda_n}(\alpha_n) \sim \psi_{\mu_1}(\beta_1)\psi_{\mu_2}(\beta_2)\dots\psi_{\mu_m}(\beta_m)$$
- Then, $\sigma(\psi_{\lambda_1}(\alpha_1)\dots\psi_{\lambda_n}(\alpha_n)) \sim \sigma(\psi_{\mu_1}(\beta_1)\dots\psi_{\mu_m}(\beta_m))$
 So, $p_{\lambda_1}(\alpha_1)\dots p_{\lambda_n}(\alpha_n) \sim p_{\mu_1}(\beta_1)\dots p_{\mu_m}(\beta_m)$
- ▶ Since this is all the restrictions on σ , but σ is unique, $\pi_1(X)$ must not have any elements which aren't in the form
- $$\psi_{\lambda_1}(\alpha_1)\psi_{\lambda_2}(\alpha_2)\dots\psi_{\lambda_n}(\alpha_n)$$

We also need to prove this.

- ▶ We'll also look at when two elements of $\pi_1(X)$ are equal and when they're different.
- ▶ But hopefully it makes sense how this theorem determines $\pi_1(X)$!

Seifert – Van Kampen Theorem Proof – Part 1

- To Prove: Every element of $\pi_1(X)$ can be expressed as

$$a = \psi_{\lambda_1}(\alpha_1)\psi_{\lambda_2}(\alpha_2)\dots\psi_{\lambda_n}(\alpha_n)$$

for $\lambda_i \in \Lambda, \alpha_i \in U_{\lambda_i}$.

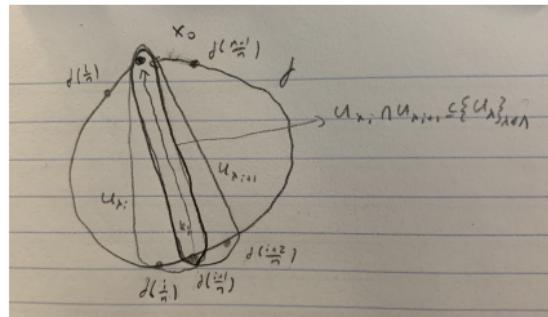

- We will use:

Lebesgue's Number Lemma: Every open cover of a compact metric space has a δ so that any subset of the metric space with diameter less than δ is contained in a single element of the cover. δ is called the Lebesgue number of the cover.

- For any $a \in \pi_1(X)$, find a path $f : [0, 1] \rightarrow X$ so that $a = [f]_{\pi_1(X)}$.
- $\{f^{-1}(U_\lambda)\}_{\lambda \in \Lambda}$ is a cover of the compact metric space $[0, 1]$. It has a Lebesgue number δ .
- Find n so $\frac{1}{n} < \delta$, divide $[0, 1]$ into subintervals $[0, \frac{1}{n}], [\frac{1}{n}, \frac{2}{n}], \dots, [\frac{n-1}{n}, 1]$. Each has diameter less than δ , so $[\frac{i}{n}, \frac{i+1}{n}] \in f^{-1}(U_{\lambda_i})$ for some λ_i , and $f([\frac{i}{n}, \frac{i+1}{n}]) \in U_{\lambda_i}$.
- Let f_i be f from $f(\frac{i-1}{n})$ to $f(\frac{i}{n})$. So,

$$f \sim f_1 f_2 f_3 \dots f_n$$

- $f(\frac{i}{n}) \in U_{\lambda_i}, U_{\lambda_{i+1}}$. Since $U_{\lambda_i} \cap U_{\lambda_{i+1}} \in \{U_\lambda\}_{\lambda \in \Lambda}$, and all elements of $\{U_\lambda\}_{\lambda \in \Lambda}$ are path connected and include x_0 , there's a path k_i from $f(\frac{i}{n})$ to x_0 contained in $U_{\lambda_i} \cap U_{\lambda_{i+1}}$.

- We add the k_i to put each small piece starts and ends at x_0 , and so is in a fundamental group:

$$f \sim f_1 k_1 \cdot k_1^{-1} f_2 k_2 \cdot k_2^{-1} f_3 k_3 \cdot \dots \cdot k_{n-1}^{-1} f_n$$

$$a = [f]_{\pi_1(X)} = [f_1 k_1]_{\pi_1(X)} [k_1^{-1} f_2 k_2]_{\pi_1(X)} \dots [k_{n-1}^{-1} f_n]_{\pi_1(X)}$$

Now, $k_{i-1} f_i k_i \subseteq U_{\lambda_i}$, since $k_i \subseteq U_{\lambda_i}, U_{\lambda_{i+1}}$. Since ψ_{λ_i} is the homomorphism induced by an inclusion map,

$$a = \psi_{\lambda_1}([f_1 k_1]_{\pi_1(U_{\lambda_1})}) \dots \psi_{\lambda_n}([k_{n-1} f_n]_{\pi_1(U_{\lambda_n})})$$

Seifert – Van Kampen Theorem Proof – Part 2

- We'd like to show that

$$\psi_{\lambda_1}(\alpha_1) \dots \psi_{\lambda_n}(\alpha_n) = \psi_{\mu_1}(\beta_1) \dots \psi_{\mu_m}(\beta_m)$$

Implies

$$p_{\lambda_1}(\alpha_1) \dots p_{\lambda_n}(\alpha_n) = p_{\mu_1}(\beta_1) \dots p_{\mu_1}(\beta_1)$$

Since paths are invertible, and everything involved is a homomorphism, we can put everything on one side:

$$\psi_{\lambda_1}(\alpha_1) \dots \psi_{\lambda_n}(\alpha_n) \psi_{\mu_m}(\beta_m^{-1}) \dots \psi_{\mu_1}(\beta_1^{-1}) = 1$$

Implies

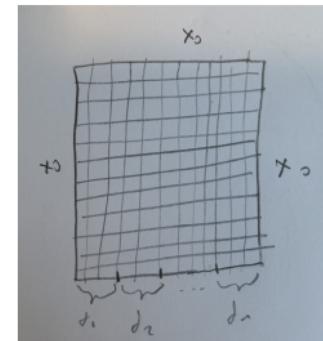

$$p_{\lambda_1}(\alpha_1) \dots p_{\lambda_n}(\alpha_n) p_{\mu_m}(\beta_m^{-1}) \dots p_{\mu_1}(\beta_1^{-1}) = 1$$

So, it'll suffice to show, $\psi_{\lambda_1}(\alpha_1) \dots \psi_{\lambda_n}(\alpha_n) = 1$ implies $p_{\lambda_1}(\alpha_1) \dots p_{\lambda_n}(\alpha_n) = 1$

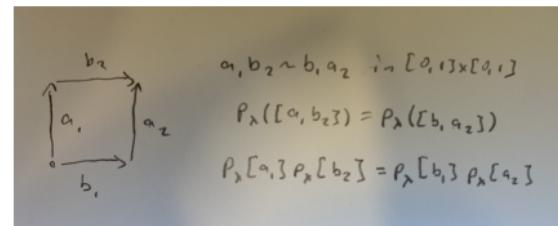

Let f_i represent $\psi_{\lambda_i}(\alpha_i)$ so $\psi_{\lambda_i}(\alpha_i) = [f_i]_{\pi_1(X)}$. If $\psi_{\lambda_1}(\alpha_1) \dots \psi_{\lambda_n}(\alpha_n) = 1$, there's a continuous function $F : [0, 1] \times [0, 1] \rightarrow X$ with $F(1, t) = F(s, 0) = F(s, 1) = x_0$,

$$F(0, t) = \begin{cases} f_1 & [0, \frac{1}{n}] \\ f_2 & [\frac{1}{n}, \frac{2}{n}] \\ \dots & \end{cases}$$

- Using the Lebesgue number, split up $[0, 1] \times [0, 1]$ into rectangles so each fits in a single U_λ , making sure that each $\frac{i}{n}$ is at a boundary:

- For each intersection, add a line k_{ij} going from the intersection to x_0 , contained in the U_λ 's of all four surrounding rectangles.
- In each line below, add k_{ij} 's as necessary to put them in the fundamental group:
For each rectangle, since it's contained in U_λ ,

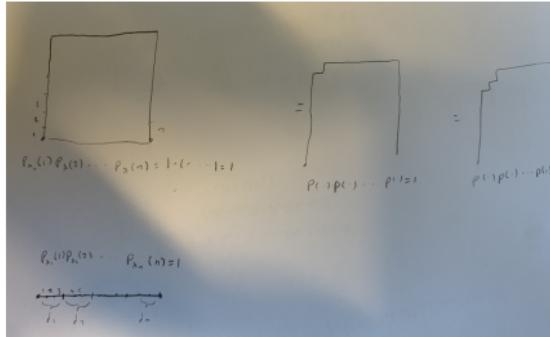

- ▶ Now, remember that

$$\begin{array}{ccc} \pi_1(U_\lambda) & \xrightarrow{\phi_{\lambda\mu}} & \pi_1(U_\mu) \\ & \searrow p_\lambda & \downarrow p_\mu \\ & H & \end{array}$$

$$a \in U_\lambda, U_\mu$$

$$\begin{aligned} p_{U_\lambda \cap U_\mu}(a) &= p_{U_\lambda}(\varphi_{U_\lambda \cap U_\mu, U_\lambda}(a)) \\ &= p_{U_\lambda}(\varphi_{U_\lambda \cap U_\mu, U_\mu}(a)) \\ p_{U_\lambda}([a]_{U_\lambda}) &= p_{U_\mu}([a]_{U_\mu}) \end{aligned}$$

- ▶ Notice that along the left, top, and right edges, p of the trivial loops is 1, so the whole composition is 1.
- ▶ Now, we can apply the previous two parts a finite number of times to move that composition to the bottom without changing its value:

- ▶ Finally, since each f_i is contained in a U_{μ_i} ,

$$\underbrace{p_{\lambda_1}([1]_{U_{\lambda_1}})p_{\lambda_2}([2]_{U_{\lambda_2}})p_{\lambda_3}([3]_{U_{\lambda_3}})}_{f_1} \underbrace{p_{\lambda_4}([4]_{U_{\lambda_4}})p_{\lambda_5}([5]_{U_{\lambda_5}})}_{f_2} \dots = 1$$

$$\underbrace{p_{\mu_1}([1]_{U_{\mu_1}})p_{\mu_1}([2]_{U_{\mu_1}})p_{\mu_1}([3]_{U_{\mu_1}})}_{f_1} \underbrace{p_{\mu_2}([4]_{U_{\mu_2}})p_{\mu_2}([5]_{U_{\mu_2}})}_{f_2} \dots = 1$$

$$\underbrace{p_{\mu_1}([123]_{U_{\mu_1}})}_{f_1} \underbrace{p_{\mu_2}([45]_{U_{\mu_2}})}_{f_2} \dots = 1$$

- ▶ Since we know F maps those sections to f_i ,

$$p_{\mu_1}([f_1])p_{\mu_2}([f_2]) \dots p_{\mu_n}([f_n]) = 1$$
